

Who actually builds these, and who is already selling them in Pakistan

A market-entry brief for electric motorcycles and scooters — the segment that competes with the 70cc commuter. Built from public sources, with the strength of each figure marked.

Compiled 25 August 2026 • Desk research • No supplier contacted

READ THIS FIRST

There is no list of 5,000 companies to find

The request was for 5,000 players. The industry does not contain them, and one number settles it: in 2025 the ten largest Chinese makers of licence-plated electric motorcycles shipped 94.0% of the entire national market. The remaining 6% is split among a long tail of small workshops and rebadgers with no published volumes, no export operation, and nothing to verify.

A 5,000-row list could be generated. It would be mostly trading-company listings scraped from B2B storefronts, self-declared and unverifiable — and it would read as authoritative while being noise. What follows is the part that is real and checkable.

SEGMENT BOUNDARY — THE MOST MISREAD FIGURE HERE

The 3.5m unit market above is **licence-plated electric motorcycles** — registered vehicles, the segment a Pakistani commuter product sits in. China's *total* electric two-wheeler market, including e-bikes and light mopeds, ran to **32.33 million units in the first half of 2025 alone**, against an installed base near 380 million.

A company can be enormous in one and absent from the other. Yadea leads both; Aima leads the broad market but does not appear in the licence-plated top ten. Trade media quote the two interchangeably, and any ranking that mixes them is meaningless.

SUPPLY SIDE

The Chinese manufacturers, ranked by units

Licence-plated electric motorcycles, calendar 2025, per the China Chamber of Commerce for the Motorcycle Industry. The ten rows below sum to 3,292,900 against a stated market of 3,506,200 — the arithmetic closes exactly, which is a good sign for the source.

#	MANUFACTURER	UNITS 2025	SHARE	EVIDENCE
1	Yadea Technology Group 雅迪 · listed, Hong Kong	921,100	26.3%	ASSOCIATION
2	Zhejiang Luyuan 绿源 · listed, Hong Kong	591,500	16.9%	ASSOCIATION
3	Zongshen 宗申 · legacy motorcycle group	465,100	13.3%	ASSOCIATION
4	Jiangsu Huaihai 淮海 · OEM/ODM operation	344,900	9.8%	ASSOCIATION
5	CFMOTO — ZEEHO 春风 · premium performance	300,300	8.6%	ASSOCIATION
6	Jiangsu Xinri 新日 · listed, Shanghai	262,900	7.5%	ASSOCIATION

#	MANUFACTURER	UNITS 2025	SHARE	EVIDENCE
7	Bus New Energy 立马 / 台铃-adjacent group	206,900	5.9% —	ASSOCIATION
8	Wuxing Vehicle 五星 · mid-tier	75,500	2.2% •	ASSOCIATION
9	Loncin 隆鑫 · legacy motorcycle group	66,900	1.9% •	ASSOCIATION
10	Tailing 台铃	57,800	1.6% •	ASSOCIATION

Two names matter more than their rank suggests. **Jiangsu Huaihai** runs an explicit OEM/ODM business — it builds under other people's badges, which is exactly the relationship a first-time importer can actually obtain. **Zongshen** and **Loncin** are legacy combustion-motorcycle giants with decades of export plumbing already pointed at markets like Pakistan.

Large in the broader market, absent from the table above

COMPANY	POSITION	NOTE	EVIDENCE
Aima 爱玛	Top-tier commuter brand	Vietnam plant in production, Indonesia commissioning — actively regionalising	PRESS
Tailg 台铃 · Shenzhen TAILG	Top-tier	⚠️ Very likely the same group as “Tailing” in the table above	PRESS
NIU 小牛 · NASDAQ	Premium / connected	Wrong price point for a 70cc replacement	PRESS
Segway-Ninebot 九号 · STAR listed	Premium / global	H1 2025 overseas revenue RMB 4.42bn, +57.7% YoY — 37.7% of total	PRESS

The export and ODM tier — where a first-time buyer actually gets a deal

COMPANY	WHY IT MATTERS	EVIDENCE
Jiangsu Huaihai	Top-five maker that <i>also</i> builds under other badges	ASSOCIATION
VMoto Super Soco · ASX-listed	China-manufactured, export-built business	PRESS
Wuxi MDKA New Energy	Advertises CKD / SKD / CBU kits openly	SELF-DECLARED
Wuxi Legend Int'l	Trading house	SELF-DECLARED
Zhejiang Taiya	CKD / SKD kits	SELF-DECLARED

NAMING TRAPS — HOW A LIST LIKE THIS SILENTLY INFLATES

Every one of these has produced duplicate rows in published “top 10” lists: **Xinri = Sunra** (新日, one company, two romanisations) · **Tailing ≈ Tailg** (台铃) · **Aima / “Emma”** (爱玛, same name rendered twice) · **ZEEHO** is CFMOTO's electric brand, not a separate maker · **Segway and Ninebot** have been one company since 2015.

Count the manufacturing entity, not the badge. This is the single mechanism by which a list reaches an impressive length without containing that many companies.

Also recorded, so they are not researched twice: **Velotric**, **Urtopia**, **TENWAYS** and **Tezeus** are Chinese-founded premium *e-bicycle* brands built for Europe and North America. Real businesses, wrong product, wrong market.

COMPANY DETAIL

What each of them is actually doing

THE MOQ CHASM — THE NUMBER THAT REORDERS THE SHORTLIST

Huaihai, a top-five maker with its own OEM/ODM arm, quotes a minimum order of **10,000 units a year**. At roughly US\$350 FOB that is about US\$3.5m — **around twenty times the entire PKR 50m capital ceiling**. The tier that will deal at 50–200 units is trading houses and small ODMs, some quoting as few as 1–5.

There is nothing in between. Scale and reachability are inversely related here, and the gap between them is exactly where a first-time entrant falls — because the reachable tier is also where the battery warranty backstop is weakest and hardest to enforce from Pakistan.

READ FROM THE AUDITED FILINGS, NOT THE PRESS

Yadea's FY2025 annual results (1585.HK), NIU's Form 20-F (SEC, CIK 1744781) and Luyuan's FY2024 annual report were read directly. Three things in them contradict what trade media reports.

AUDITED	REVENUE	NET RESULT	NET MARGIN	VEHICLE UNITS	INTER
Yadea 1585.HK · FY25	RMB 37.01bn	+2.91bn	7.87%	16,269,200	Vietnam p
Aima 603529.SH · FY25	RMB 25.10bn	+2.04bn	8.11%	11,639,817	0.8
Luyuan 2451.HK · FY24	RMB 5.07bn	+116.1m	2.29%	—	HKD 6.1
Xinri 603787.SH · FY25	RMB 4.11bn	+50.6m	1.23%	2,284,597	2.48% (
NIU NASDAQ · FY25	—	-39.4m	loss	1,192,039	6.7%

THE LEAGUE TABLE ABOVE DOES NOT SURVIVE THE FILINGS

The ranking every trade publication reprints — and which this brief reproduced — puts the 2025 licence-plated market at 3,506,200 units with a top ten holding 94%. The companies' own audited accounts say otherwise. Aima filed 2,615,982 electric two-wheeled motorcycles — 74.6% of that entire “total market” — and does not

appear in the table at all. Xinri's own accounts show 459,833 against the 262,900 credited to it, **75% higher**. Two companies alone report 3,075,815 units.

The gap is probably definitional — “licence-plated” likely counts something narrower, and association tables cover members. **But the reconciliation is unknown, so the ranking cannot support a decision.** Treat the audited filings as the only reliable volume source.

THREE THINGS THE FILINGS SAY AND THE PRESS DOES NOT

1. Yadea sold more batteries than vehicles. 18.3 million batteries against 16.3 million vehicles; batteries and chargers are **28.4% of revenue — RMB 10.5bn**. The recurring money in this industry is batteries, not machines. It also reframes K5: the market leader *monetises* battery replacement rather than absorbing it.

2. Only Yadea makes real money. NIU has lost money three years running — RMB 271.8m, 193.2m, then 39.4m — at essentially *the same gross margin as Yadea*. Scale, not pricing, separates them. Luyuan runs at 2–3% net. **A thin-margin supplier cannot subsidise your market entry**, which is exactly what an enforceable battery backstop would require.

3. These are domestic Chinese businesses with an export gesture attached. Aima — described everywhere as aggressively regionalising — filed **overseas revenue of RMB 216.2m, 0.86% of turnover, and it FELL 7.89%**. Xinri exports at **9.95% gross margin against 14–21% domestically**: exporting is its least profitable channel. NIU sold **80,018 units internationally** across partners in 40+ countries — about 2,000 per market per year. Luyuan's international budget was **HKD 6.1m, “delayed and unutilized”**.

WHICH NARROWS THE PARTNER FIELD TO ALMOST NOTHING

If you want a Chinese partner with real export capability and appetite, the field is essentially Yadea — whose Pakistan territory is already taken — and the ODM/trading tier. Everyone else is a domestic Chinese business. A partner for whom export is under 1% of revenue and falling will not fund your warranty claims, your marketing or your credit terms. That is K5 and K11 in one sentence.

Every one of these filings points at Southeast Asia — Vietnam's motorcycle restrictions, Indonesia's fuel-to-electric subsidies. **None of them names Pakistan.**

WHAT THAT CALIBRATES

Ex-works ASPs derived from Yadea's audited table are **RMB 1,415 per electric bicycle and RMB 1,878 per electric scooter**. Combine that with ~2,000 units per foreign market per year and the shape is clear: **a Pakistani distributorship is a small-volume, thin-margin business** whatever the size of the manufacturer behind it. Return has to come from distribution, service, batteries or financing — not from the vehicle. That is a direct input to K9.

Yadea 雅迪 **PAKISTAN TAKEN**

Converting domestic dominance into Southeast Asian manufacturing. 2025 revenue RMB 37.0bn (+31.1%), net profit RMB 2.91bn — up 128.8%, on 16.3 million units. Building a US\$100m Vietnam plant at 1m units/year; Indonesia R&D since 2024; exports to 100+ countries. Moving up-market on sodium-ion batteries.

● Its 921,100 licence-plated motorcycles are just 5.6% of its total volume — the league table everyone quotes measures a sliver of what these firms do.

Huaihai 淮海 **ALREADY HERE**

Founded 1976. Three brands — Huaihai, Zongshen, Hoann — 27 subsidiaries, assets over RMB 10bn, a network across 96 countries, and overseas bases in Pakistan, India, Chile, Peru and Indonesia.

⚠ Zongshen and Huaihai are entangled — Jiangsu Zongshen Vehicle was jointly established by both in 2003, and Jiangsu Zongshen Automobile is a Huaihai subsidiary. Ranks 3 and 4 may be one group: 810,000 units, 23.1%, near Yadea.

Luyuan 绿源 **WORTH ASKING**

Competing on engineering, not price. Revenue ~RMB 5.91bn, net profit up 50%+, fifth largest by revenue. Differentiator is **proprietary liquid-cooled motor technology** sold on motor lifespan — a durability claim that suits Pakistani roads. Earlier in its export

Aima 爱玛 **ASK EARLY**

Regionalising right now. Vietnam plant in production, Indonesia commissioning — Yadea's path, one step behind. Leads the *broad* market but is absent from the licence-plated top ten, so its mix leans to e-bikes and mopeds. Either receptive to a South Asia conversation, or already

journey than Yadea, which may make it more approachable.

forming its own plans. Worth reaching before those harden.

WHY THEY ARE ALL SUDDENLY INTERESTED IN EXPORTING

A new national standard took effect in November 2024, regulating batteries and chargers, and with a 2025 trade-in policy it is forcing a replacement peak at home. Lithium e-bikes rose from 4.62m units in 2024 to ~5.44m in 2025 as safety rules push lead-acid out. The domestic market is vast but maturing — 49.6m e-bikes sold in China in 2024 against a stock above 400 million.

● **Two consequences for Pakistan.** The cheap lead-acid machines being regulated out of China are exactly what an emerging market absorbs — expect them to be offered, and expect the warranty exposure that travels with them. And **battery swapping is where the Chinese industry is actually investing** (US\$460m in 2025, heading to US\$1.25bn by 2031, 73.85% lithium) — while Pakistan's own NEV Policy plans swapping stations for two- and three-wheelers. That is a business adjacent to vehicles that does not require competing with two million units of idle assembly capacity.

DEMAND SIDE

Pakistan is not an emerging market for this. It is an exploding one.

GOVT 2-WHEELER
ADOPTION TARGET,
2025-30 TOTAL

A single quarter of 2026 came within a fifth of the whole of 2025. The overall two-wheeler market hit an all-time high of 1.93 million units in FY26, with the first half of 2026 up 33.8% — so electric is growing against a rising base, not cannibalising a flat one.

The government's own **New Energy Vehicles Policy 2025–30** targets 116,053 electric two-wheelers in 2025-26 rising to 740,898 by 2029-30, and sets cost-sharing at a reference **PKR 65,000 per two-wheeler** against a five-year budget of PKR 85 billion.

READ THE TARGETS WITH THE POLICY'S OWN ADMISSION ATTACHED

The policy opens by stating that *“the 2019 policy failed to meet its five years targets”* and that its supply-side measures *“have not been fully implemented till now.”* A target set by a ministry that missed the last one is an intention, not a forecast. It must never become a demand assumption in a cost model. The subsidy is also designed to shrink — to 80% of face value in year three, 60% in year four, 40% in year five.

THE CURRENT TARIFF STRUCTURE – FOUND, AND IT IS A ONE-YEAR BRIDGE

The NEV Policy says AIDEP 2021–26 incentives ran *“till the end of the policy period i.e June 30, 2026”*, which reads like a cliff already passed. It is not: **the Finance Act 2026 extended the EV concessions by one year**. FBR's own budget document says *“Extension in exemption on import of CKD for electric vehicles till 30.06.2027”* and, in its own words, *“Extension in date of **sunset** for electric vehicles till 30.06.2027.”*

For electric motorcycles — **PCT 8711.6040** — the rate is **1% customs duty on EV-specific components in kit form**, with **10–15% on non-localised CKD parts**, under Table-II to Part-V(A) of the **Fifth Schedule to the Customs Act 1969**.

THE GATE BEHIND THAT RATE IS WRITTEN FOR A DIFFERENT CENTURY

The 1% is not automatic — it requires *“certification and quota determination by the Engineering Development Board”*, measured against the facility schedule in **SRO 656(I)/2006**. That schedule **contains no electric-vehicle provisions at all**. The only occurrence of the word “electric” in the entire instrument describes a crane hoist.

The motorcycle schedule an e-bike assembler would be judged against mandates an **“ENGINE ASSEMBLY & TESTING”** line with fixtures for *“Crank Cases”*, *“Complete Cylinder with Crankshaft and Connecting Rod”*, *“Spindle Kick Starter”*, *“Spark Plug*,

Rocker Arm and Tappet adjusting” and *“Oil Filling”* — plus an **emission tester** at final inspection.

An electric motorcycle has none of those things. So certification rests on how EDB chooses to apply an obsolete instrument, not on a published standard you can measure yourself against. You cannot self-assess eligibility, cost or timeline before applying — and one applicant's acceptance does not bind the next. **This is the question to ask before anything else in the project proceeds.** It may also explain why 50+ licences have been issued while only about six holders reportedly manufacture.

And the bridge ends on 30 June 2027, roughly ten months out. The successor policy — AIDEP 2026-31 — is still a draft awaiting both the Prime Minister and the IMF, with manufacturers contesting its tariff cuts, and published analysis of the draft notes two-wheelers are not separately addressed in it. Meanwhile FBR is pruning the Fifth Schedule, deleting entries *“where concessionary CD equals or exceeds the First Schedule general tariff.”* **Model the case twice — with the concessions and with none.**

THE INCUMBENTS

Who is already importing and assembling in Pakistan

This is the closest available answer to “who is bringing the units in”.

Shipment-level customs records — which exporter shipped to which importer — sit behind paid subscriptions and were deliberately not bought. What follows is the licensed and publicly-trading field instead.

The licensing picture

The Engineering Development Board has issued 50+ **manufacturing licences**, mostly for electric bikes and rickshaws. At an earlier count of 31 licences, only about **six** were actually manufacturing.

The confirmed China → Pakistan link

Yadea — the world's largest maker — is **already in Pakistan**, via a partnership with **Road Prince**, with the T5 retailing around PKR 245,000.

Treat the market leader's territory as spoken for until proven otherwise. That

Press reporting puts roughly 84 companies in the space — a mix of shoestring operations, venture-backed startups and existing industrial groups. A licence is not a factory.

is a K3 finding and it removes the most obvious target from the list.

PAKISTANI PLAYER	POSITION	NOTE
Jolta Electric	Early licensed assembler	Among the first approved to assemble locally; 50+ service points claimed
MS Jaguar MS Group of Industries	In-house manufacturer	Group trading since 1984; EV line from 2021, built under MS Automobiles
Vlektra	Karachi, founded 2020	Positioned on higher performance and an integrated ecosystem
Sazgar Engineering	Listed industrial group	Established two- and three-wheeler manufacturer moving into EV
Road Prince	Distribution partner	Route by which Yadea reaches the Pakistani market
Okla · Crown · United Auto · Metro · ELFA · Pakzon · E-Turbo · EcoDost	Active brands	Repeatedly listed among established local suppliers; individual volumes unpublished

CHECKED AGAINST PAMA AND EDB — AND ONE FIGURE DID NOT SURVIVE

PAMA does not count these companies. Its membership was checked directly: of every electric two-wheeler name above, **only Sazgar is a member**. Jolta, Vlektra, MS Jaguar, Road Prince, Metro, Pakzon, Crown, Okla and EcoDost are all absent, so their volumes are not in PAMA's statistics.

An earlier version of this brief put electric penetration at “~8–9% of the two-wheeler market”. **That figure is withdrawn.** It divided a press-sourced electric number by a total-market number that is essentially PAMA-member sales — overwhelmingly combustion, and excluding almost every electric maker. Numerator and

denominator came from different populations, which makes the ratio meaningless however reasonable it looked.

The EDB publishes no licence register that could be found. The counts in circulation — “31 licences, about six actually manufacturing”, later “50+” — are press attributions to EDB officials, not documents. They may be right; they are not sourced.

THE FILTER

Which of them could a first-time entrant actually work with

Filtered against the constraints already set for this project: roughly PKR 50m of capital that can be lost entirely, no existing trade relationships, and a policy regime that taxes assembly inputs at a fraction of finished-vehicle rates. Ranked by whether a deal is plausible, not by how impressive the manufacturer is.

A **Yadea** LIKELY CLOSED

Market leader at 26.3% and already partnered with Road Prince in Pakistan. The obvious target is almost certainly the unavailable one. Worth one confirming question, not a strategy.

B **CFMOTO / ZEEHO** WRONG SEGMENT

Premium performance machines. Real volume, but aimed nowhere near a 70cc-commuter replacement. Excluded on product fit rather than availability.

C **Luyuan · Zongshen · Xinri · Loncin · Tailing** ASK

Large enough to be credible, and — for Zongshen and Loncin especially — already running export operations into markets like Pakistan. The open question is whether any will appoint a first-time buyer at this capital scale. That is answered by asking, and by nothing else.

D

Jiangsu Huaihai

MOQ BLOCKS THE OBVIOUS ROUTE

An earlier version of this brief ranked Huaihai as the most plausible target. Its OEM/ODM minimum is 10,000 units a year — roughly twenty times the capital ceiling — so that route is closed. But it **already operates a base in Pakistan**, which makes the useful question not “will you supply me” but “**what are you already doing here, and does it need a local partner?**”

E

The ODM and trading tier

THE ONLY TIER THAT FITS

Wuxi MDKA, Wuxi Legend, Zhejiang Taiya and the wider Alibaba layer quote CKD and SKD kits at 50–200 units, some as low as 1–5, with production in 15–25 days and sea freight in 25–35. It is the only tier that fits the capital available — and the tier where a **battery warranty backstop is weakest**, which is precisely what K5 exists to catch.

CORRECTION — THE OBVIOUS PLAN DOES NOT SURVIVE THE PRIMARY SOURCE

An earlier version of this brief concluded that CKD assembly with a mid-tier or ODM partner was the configuration that survived every constraint. Reading the NEV Policy directly removes that conclusion. The policy states that *“local assembly and production capacity of electric two and three-wheeler has risen to two 2 million vehicles per annum. However, much of this capacity is heavily underutilized.”*

Pakistan does not need another assembly line. It has roughly two million units a year of installed capacity standing idle, and the government's demand-side measures exist to fill capacity that already exists. Adding supply to a market whose stated problem is underutilisation is not a strategy — and the fact that idle capacity has not already captured this opportunity is the single most important thing to understand before committing anything.

SO WHERE DOES THAT LEAVE THE ENTRY QUESTION

If capacity is not scarce, the scarce things are what capacity cannot supply: **demand generation, distribution reach, brand trust, after-sales and parts, and consumer financing.** An entry thesis should be built on one of those, or on **using someone else's idle line rather than building one** — a far lighter call on capital, and one that fits the constraints better than importing or assembling ever did.

That reframing does not weaken the case. It relocates it. But it cannot be confirmed until a manufacturer is actually asked.

One documented on-ramp worth confirming

AIDEP 2021-26 allowed 10 built-up units per variant at half the prevailing customs duty, up to 200 units per company, across scooters, motorcycles, rickshaws and loaders — with “*subsequent manufacturing within 2 years of import*” made compulsory, EDB recommending and MoIP approving.

Import a couple of hundred units at half duty, prove the market, then commit to building. That fits a capital-constrained first entry far better than either full CBU importing or a plant from a standing start. ● But AIDEP expired on 30 June 2026 and it is unconfirmed whether the two-wheeler pilot survived — only the four-wheeler version is known to continue. It is the most useful provision found so far, and it may no longer exist.

LIMITS

What this brief does not establish

- **No supplier has been contacted.** Every availability judgement above is inference from public evidence. Whether a manufacturer will supply you is answerable only by asking.
- **No shipment-level records.** Which exporter shipped to which Pakistani importer requires a paid customs-data subscription that was deliberately not purchased.
- **The Chinese table is one segment.** Licence-plated electric motorcycles, calendar 2025. Not e-bikes, not mopeds, not the broader tens-of-millions market.
- **Pakistani market figures remain press-reported.** PAMA's own data files were not obtained — only its membership, which is what exposed the denominator problem. A defensible penetration rate needs registration data, where numerator and denominator count the same population.
- **The Fifth Schedule text itself has not been read** — only FBR's budget summary and the Board of Investment's description of it. The exact component list and serial numbers still need checking at source.

- **How EDB applies an ICE-shaped facility schedule to an electric two-wheeler is unknown** — and it gates the 1% rate. No published standard exists to self-assess against.
- **Whether the 200-unit two-wheeler CBU pilot survived the AIDEP expiry is unconfirmed.**
- **PKR 65,000 versus PKR 80,000 is unresolved.** The policy says 65,000; press reporting says 80,000 for a separate programme. Until that is settled, only the policy figure is sourced.

Official bilateral trade statistics were also pulled for this work. They are held privately in the project workspace and are deliberately not reproduced here — the licence governing them prohibits redistribution.

Compiled 25 August 2026 for a personal go/no-go on entering the electric two-wheeler business in Pakistan.

Revised the same day after checking the primary sources — which withdrew one figure and reversed the central recommendation. Every figure carries its evidence grade because the decision depends on which ones are load-bearing, and the two that mattered most did not survive contact with the documents.
